

Securing the web architecture means securing ...

entertainment

• The DNS (Domain Name System)

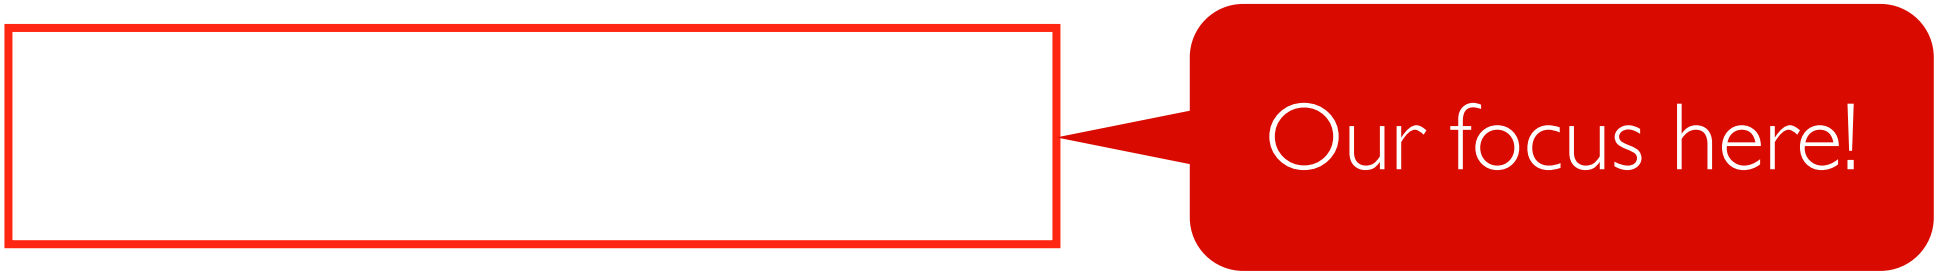

• The web server operating system

- The web server application (Apache for instance)

- The database application (Oracle for instance)

• The new user

• The new web application

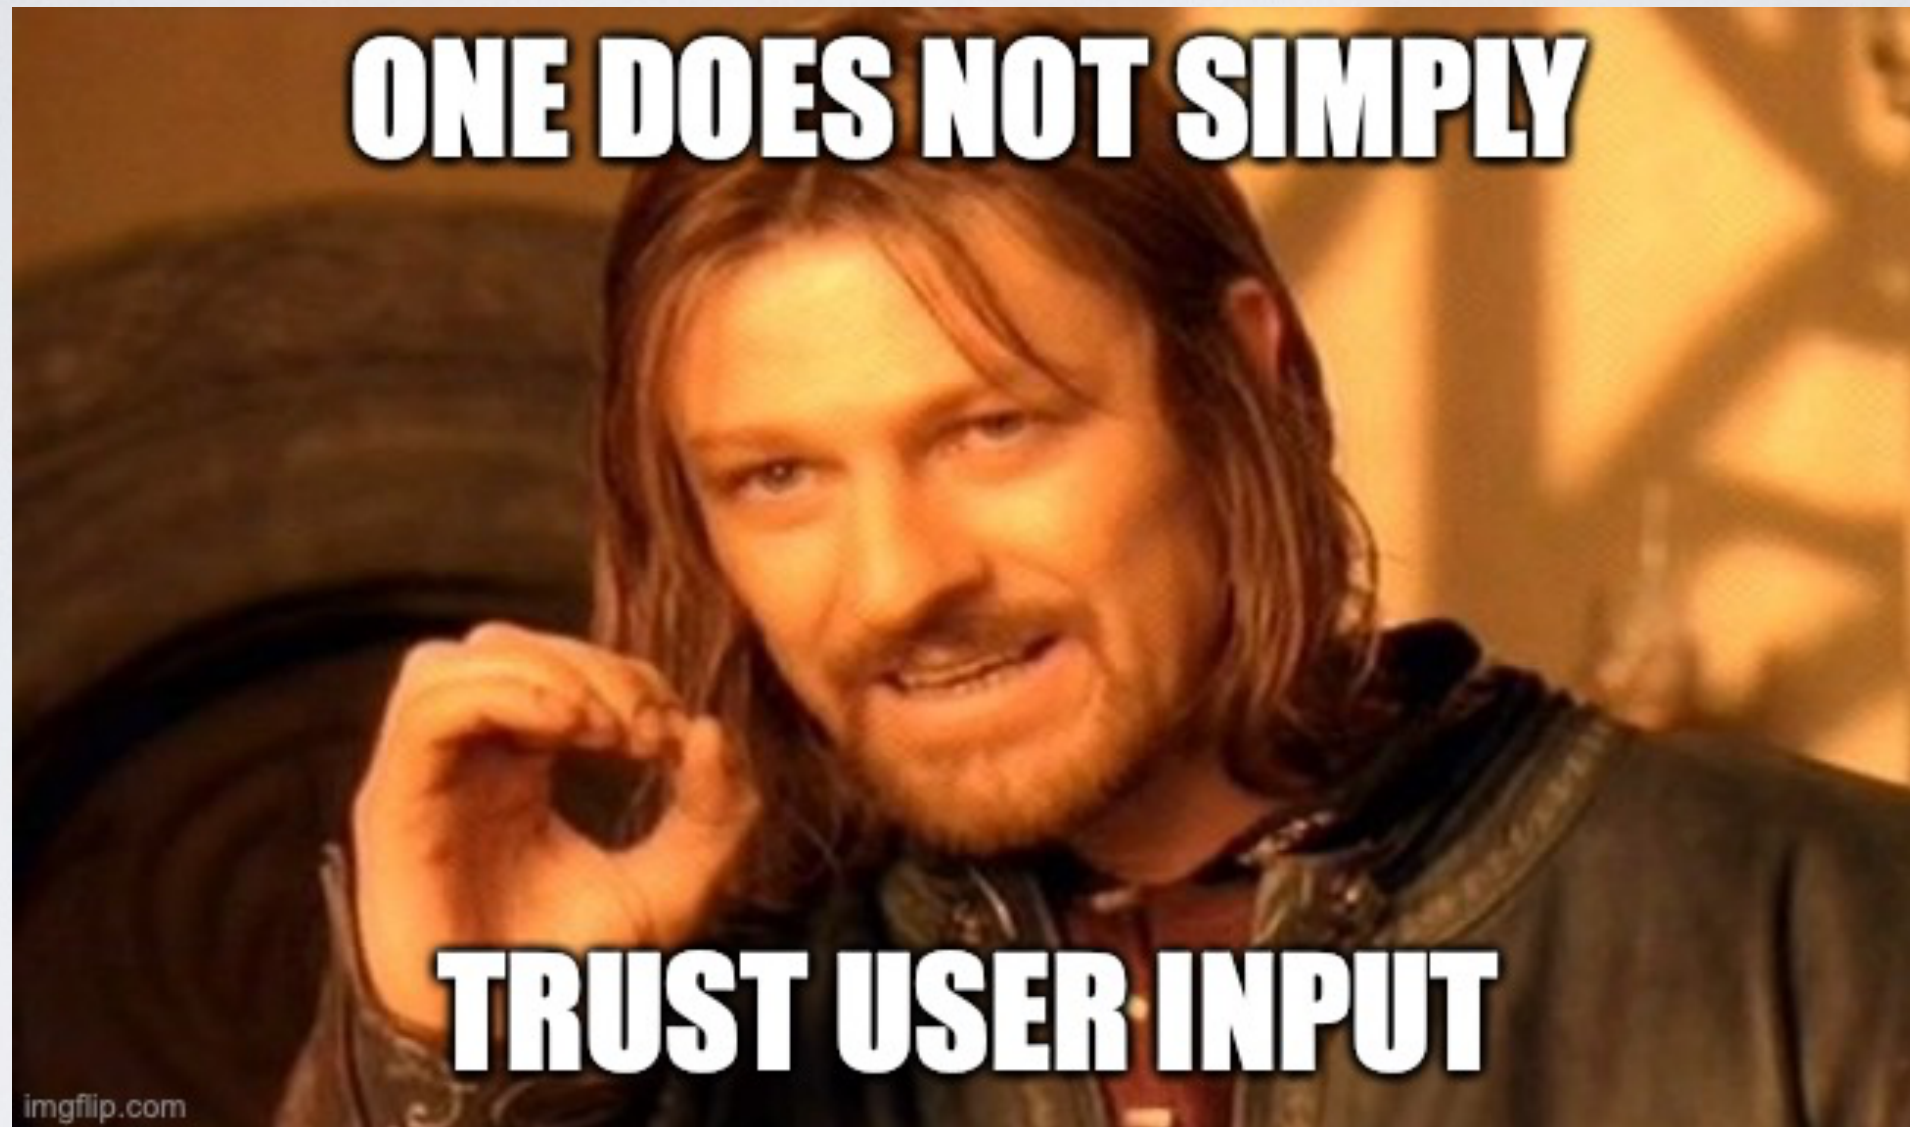

Securing the web architecture means securing ...

- The network
- The DNS (Domain Name System)
- The web server operating system
- The web server application (*Apache* for instance)
- The database application (*Oracle* for instance)
- The web user
- The web application

Our focus here!

Challenges of Web Security - TLDR;

- All user input is untrusted
